High Density and Accurate I/P Solutions for Control Valves

Pharmaceutical facilities often require the control of several smaller valves to help control batch processes. Often these valves are smaller than field mount I/Ps that would typically bolt onto the valve or beside the valve.

The DIN-rail and rack mounted IPT2 I/P can be mounted in high density cabinets to reduce cost and maintenance. These units have a closed loop feedback system that ensures maximum accuracy and long term repeatability. Special header racks are also available that minimize piping and allows the use of centralized desiccant filters and pressure regulators for multiple DIN mounted IPT2s.
