

# Demand Moore Reliability

## Monitoring Acid Level Temperatures Wirelessly

A petrochemical producer of super absorbency products needed to monitor the temperature of acrylic acid being piped about three-quarters of a mile away from the plant to ensure it didn't freeze and solidify. Their path was blocked by existing structures and other obstructions.

The WNM Wireless Network Module and NCS NET Concentrator System® eliminates the need for hardwiring and can work around obstructions. A simple site survey can show the viability of a wireless distributed I/O solution.
